# PAVAN KUMAR VINJAMARA

Hyderabad, Telangana, India | +91-7660873035 | pavanvinjamara323@gmail.com | LinkedIn | GitHub

## PROFESSIONAL SUMMARY

Full Stack Java Developer with 3+ years of experience in Java, Spring Boot, React.js, and PostgreSQL. Experienced in developing scalable microservices and secure REST APIs, improving API performance by up to 60% and reducing database load by 35%.

## TECHNICAL SKILLS

**Backend:** Java, Spring Boot, Node.js, Express.js, Microservices, Spring Security, Hibernate, REST APIs, System Design.
**Frontend:** HTML, CSS, JavaScript, TypeScript, React.js, Redux, Vue.js, Pinia, Next.js, Tailwind CSS, Bootstrap.
**Data, Cloud & DevOps:** PostgreSQL, MongoDB, Redis, Kafka, Socket.io, AWS (EC2, S3, Lambda), Docker, Kubernetes, Jenkins, CI/CD
**Security & Testing:** JWT, OAuth2, RBAC, Rate Limiting, VAPT, JUnit 5, Mockito, Jest, Git, Postman

## WORK EXPERIENCE

### Full Stack Developer | Zygal (Product-Based Company) — Aug 2023 – Present

*Pune, Maharashtra*

**Projects:** IIFL-Eye, Admin Panel, Zygal Connect, WebV2, Agent

***Vendor & Service-Operations Management Platform (Financial Services)***

- Built a two-portal system (internal admin/SOC portal and external vendor portal) using Vue 3, Pinia, and Vue Router on the frontend with a Node.js/Express REST API and MongoDB on the backend, serving distinct role-based experiences for bank-side staff and third-party service vendors.
- Implemented JWT authentication with httpOnly refresh-token cookies and role-based access control (RBAC) across five roles (vendor_admin, engineer, analyst, readonly, and internal SOC staff), including vendor-data isolation so accounts could only access their own vendor's records.
- Designed an SLA-tier and penalty-rule engine covering breach detection, penalty raising, vendor disputes, and admin waive/reject/payment-confirmation workflows for tracking vendor service-level compliance.
- Built a cross-vendor ticketing system with filterable admin views, status workflows, and file-upload-based resolution, plus real-time notifications via Socket.io.
- Developed bulk branch-onboarding via Excel import/export (SheetJS) with validation for duplicate and malformed rows, and MIS reporting dashboards using Chart.js.
- Hardened the API layer with Helmet, express-rate-limit, and Joi request validation, and wrote 130+ automated tests (Jest/Supertest on the backend, Vitest/Vue Test Utils on the frontend) covering auth flows, RBAC enforcement, and vendor-isolation logic.

***AI Detection & Camera Management Platform***

- Led end-to-end ownership of the camera management and AI detection platform across 4 product modules, driving frontend (React.js, Chart.js, Fabric.js), backend (Spring Boot, Kafka, Redis), and AI/ML (YOLOv11) development from design through deployment.
- Trained and fine-tuned YOLOv11 object detection models for real-time AI-based surveillance detection, improving detection accuracy and shrinking manual review effort by 50% across live camera feeds.
- Built a Fabric.js canvas editor to visually mark and configure AI detection zones and bounding boxes on the frontend, trimming manual zone-setup time by 70% and reducing misconfigured zones.

***Operations & Analytics Dashboard***

- Developed Chart.js dashboards with real-time KPI tiles, drill-down filters, and export options, handling 1M+ AI detection records with 45% faster data loads — used daily by the operations team.
- Built automated device health monitoring with email/SMS alerts for offline or malfunctioning cameras, shortening incident response time by 50%.

***Core Backend Platform & Event Pipeline***

- Led migration of a legacy monolithic surveillance system into independent Spring Boot microservices (camera, detection, device-health, analytics), enabling zero-downtime deployments, tripling release frequency, and cutting deployment-related incidents by 25%.
- Optimized database queries with indexing, pagination, and Redis caching, bringing API response time down from 2s to under 800ms (60% faster) and lowering peak database load by 35%.
- Designed Kafka-based event pipelines for device-to-platform communication, improving system throughput by 40% and ensuring reliable delivery of device and detection events.
- Executed asynchronous processing with Java multithreading to handle parallel updates across camera, device, and detection tables, keeping data consistent under high concurrent load.
- Built and delivered 20+ RESTful APIs (Spring Boot, Hibernate, JPA) for camera management, AI detection, device health monitoring, and dashboard analytics, lowering manual admin workload by 50%.

***Security & Subscription Management***

- Enforced JWT authentication and RBAC to manage subscription-based feature access across microservices for 10,000+ users.
- Identified abusive traffic patterns hitting detection and analytics APIs; applied rate limiting, request validation, and IP-based filtering to stop the abuse and protect backend and database capacity.
- Designed tiered, subscription-based feature-gating logic, allowing the product team to launch new pricing plans without backend code changes.

***Production Support & Client Engagement***

- Provided production support for live client deployments, troubleshooting and resolving production issues through log analysis, root-cause analysis, and hotfixes to keep systems stable with minimal downtime.
- Participated in VAPT (Vulnerability Assessment & Penetration Testing) cycles and remediated reported vulnerabilities across web applications and APIs, helping releases clear client security audits.
- Interacted directly with clients to gather requirements, demo new features, and resolve reported issues, translating client feedback into technical tasks for the team.

***Cross-Team Contributions***

- Collaborated with a cross-functional team of 10+ across product, QA, and DevOps in an agile environment — sprint planning, code reviews, and release management for on-time delivery across all projects.
- Reviewed code and mentored 3 junior developers on Spring Boot and React best practices, improving overall code quality and cutting rework by 20%.
- Maintained 85%+ test coverage with JUnit 5 and Mockito, and streamlined CI/CD pipelines with Jenkins and Docker, reducing production incidents by 30%.

### Full Stack Developer Trainee | Newton School (Training Program) **2022 – 2023**

*Remote*

- Built 3+ full-stack applications using Spring Boot and the MERN stack, shipping REST APIs, JWT authentication, and responsive UI components under mentor guidance.
- Practiced data structures, algorithms, and system design through structured problem-solving sessions and 50+ mock technical interviews.
- Collaborated on 5+ team coding projects using Git-based workflows and peer code reviews, building production-ready development habits.

## EDUCATION

**M.Sc. in Computer Science — Mia Digital University, Spain** | 2022 – 2024 | Score: 85%

**B.Tech in Mechanical Engineering — TKR College of Engineering & Technology, Hyderabad** | 2017 – 2021 | CGPA: 7.67
